My first time at Orcan - and wearing a kimono!

A few months ago I got an invitation from the Swedish Oracle User Group (Orcan) to present at their event, which I agreed to do. It was my first time in Sweden and it was an unbelievable experience. The environment is so nice there... a lot of green (trees), a lot of water, nice people...

About the event itself, it started all normal. My first presentation was "Mastering an APEX Page", which you might have seen me doing before. I basically explained how an APEX page works and how/where to change things so you get exactly what you want.

But this event was in a SPA hotel... a very relaxing environment with hot tubs, steam baths etc. and everybody was wearing a kimono!

My second presentation I did in such a thing! It was very strange in the beginning to be wearing a kimono, but soon it became very nice and comfortable. I talked about my experiences going from APEX 3.x to 4.0 and demoed a lot of the new features in 4.0.

"We make reporting **easy**."

Watermark
my own watermark
AOP supports watermarks in a PDF. You can define up to 4000 characters for your watermark by setting the global variable g_output_watermark in Init PL/SQL Code.
example: aop_api_pkg.g_output_watermark := 'my own watermark';
Template and Data Source being used by the AOP APEX Plug-in
Instead of using the APEX Plug-in, you can do it from PL/SQL too

Administration

Examples : PowerPoint :

Native Office Charts

PowerPoint

AOP is able to generate native office charts that you can further manipulate by opening the output unlike JET charts where a screenshot is taken. It is also possible to dynamically change the layout of the chart. The default options for the native charts are as follows:

```
defaultOptions = {
        width: 3486488 / 9525, // width of the chart
        height: 3200400 / 9525, // height of the chart
        grid: true, // If a grid should be shown
        border: true, // If a border should be shown
        title: false,
        legend: {
            showLegend: true, // If the legend should be shown
            position: 'r'  // 'l' for left, 'r' right, 'b' bottom, 't' top
        },
        axis: {
            x: {
                orientation: 'minMax', // or "maxMin"
                min: undefined, // a specific number
                max: undefined, // a specific number
                type: undefined, // or "date"
                date: { //date options
                    format: 'unix',
                    code: 'MM/yy',
                    unit: 'months',
                    step: '1'
                },
                showValues: true //options to disable showing the values in axis

            },
            y: {
                orientation: 'minMax',
                min: undefined,
                max: undefined,
                showValues: true // options to disable showing the values in axis
             },
            y1: { //If using multiple charts and axis on the right side
            orientation: 'minMax',
            min: undefined,
            max: undefined,
            showValues: true // options to disable showing the values in axis
            }
        }
    }
```

It is also possible to generate multiple series chart. More info can be found on page 5004 . The tag used in Word, Excel and Powerpoint are the same and the structure is the same to generate native office charts.

@apexofficeprint and @OracleAPEX is a winning combination. We implemented Cloud AOP at a client 2 weeks ago, already at 300 prints a day. From awesome looking Excels via an APEX IR to customer facing pdfs via JSON and a web service call. RIP BIP! #orclapex

Just seen a demo of Apex Office Print by the man who wrote it. I configured the AOP server before (we offer it to clients on our APEX hosting system) but I hadn't realized how good it is. Any APEX site should look at it.
